

10 Reasons Why Camms is the Ultimate Choice for Managing GRC

With so many GRC platforms to select from, it can be challenging to choose the right solution for your governance, risk, and compliance requirements.

Here are 10 reasons to choose the Camms platform for GRC...

1 Built on the Latest Technology

Demonstrating our commitment to innovation, the Camms platform has recently been rebuilt on the latest technology to ensure the solution is stable and fit for the future. These upgrades have made the platform faster and more responsive than ever before – resulting in sub-second load times. Our agile approach and extensive road map means we never stop enhancing the platform and regular quarterly updates are used to release all of the latest functionality to users.

2 Highly Secure

The Camms platform has achieved SOC Type 1 & 2, ISO 27001, and Cyber Essentials certification and we have implemented many new security enhancements to ensure client data is protected to the highest standards.

3 Modern Intuitive User Interface

Clients love the modern, easy to use, intuitive user interface. Popup windows make it easy to add or edit risks, risk categories, risk types, risk ratings, risk treatments, actions, and rating calculations. Folder structures are collapsible giving more room on screen. Most fields have a search option at the top and some fields even suggest text as you start to key in values – ensuring fast data entry and consistency. Filter icons enable users to enter specific values to sort lists by.

4 Flexible Risk Register

The digital risk register is populated by online forms that feed directly into the platform. Users can create an unlimited number of risk types and risk registers and easily filter based on these categories to get a deeper understanding of different risk areas and types. Templates are available to create new 'risk registers' or 'risk types' and these can be further customised. Risk types can be classified into clusters to understand risk in specific areas. Risk types are displayed in a folder structure for ease of navigation.

5 Easy to Prioritise Tasks & Actions

Every user has their own 'My Quick update' page where they get an instant count of their risks, actions, tasks, and responsibilities - this will highlight their most urgent tasks and activities. These pages update instantly when tasks are assigned, or filters are added.

6 Multiple Languages

The platform is available in multiple languages, meaning global staff can enter details in their native language across different sites and regions.

7 Flexible Permissions Hierarchy

The platform enables organisations to set up complex permissions hierarchies based on roles and responsibilities. This means staff only see information that is relevant to them, simplifying data entry and task prioritisation. The tool can link to your active directory ensuring only active staff are assigned responsibilities. This helps to safeguard and protect data and ensures management have the oversight they need. Every piece of activity can be traced back to the relevant user, ensuring accountability.

8 Best-Practice Risk Assessments

Automated workflows can be set up to roll out risk assessments at regular intervals. These can be completed by staff using online templated forms that feed data directly into the platform. Staff can easily complete risk assessments and checks online and upload evidence and photos. The user-friendly risk assessment area enables users to rename 'assessment tabs' and change the order.

9 Dashboards & Reporting

The platform offers a variety of interactive dashboards enabling users to get a quick overview of their risk profile. The solution offers a wealth of reporting capabilities including static SSRS reports and executive dashboarding for external stakeholders. Interactive reports in Power BI and Tableau are also available. All reports can be easily customised to fit any specific reporting requirements. The risk register report and risk heatmap reports have the functionality to categorise confidential risks and log initial causes and consequences - and they calculate an aggregated risk rating. Risk appetite ratings, KPI's and incident & action records can be viewed from the heatmap report.

10 Mobile App

Our recently upgraded mobile app allows staff to add risks, perform risk assessments, and action tasks anytime, anywhere. Users can add new tasks, projects and action items offline, and enhanced push notifications will notify users of urgent events in real time.

Camms is more than a GRC Platform...

Our GRC capabilities are available as part of a wider platform, offering a whole host of functionality that can be used across multiple teams and business functions - enabling organisations to integrate teams like never before - producing valuable business intelligence for leadership teams & enhancing information sharing.
